

Current Rainfall and NDVI

This report is a compilation of climate data on Somalia that FSAU and FEWSNET regularly review for analysis. Primary data source for this information is NOAA/USGS and MARS-JRC. Given the lack of functional meteorological stations network and insecurities in Somalia, information provided here is primarily based on remote sensing and modeling, hence the information is susceptible to inconsistencies and gaps. For triangulation by field observation, interpretation and analysis please refer to the climate sector article in FSAU's Monthly Food Security and Nutrition Brief.

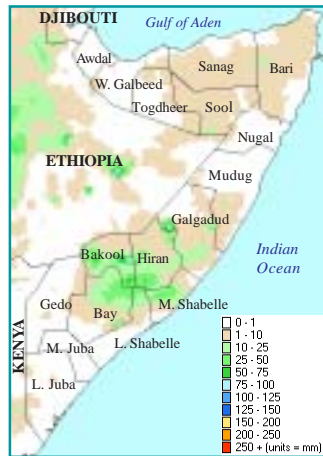

Maps and graphs on page 1 and 3 are based on data from NOAA/USGS and produced by FEWSNET Somalia and FSAU. Maps and graphs on page 2 are produced by MARS-JRC.

Climate in Somalia is influenced by the northerly movement of the Inter Tropical Convergence Zone (ICTZ), which is responsible for the bimodal rainfall pattern which the country experience annually. From April to July, the northerly movement of the ICTZ brings the major *Gu* rains and the southerly movement of the same from between September and November results in the minor *Deyr* rains. The rainy seasons are separated by two dry spells, *Jilaal* (January-March) and *Hagaa* (July-September).

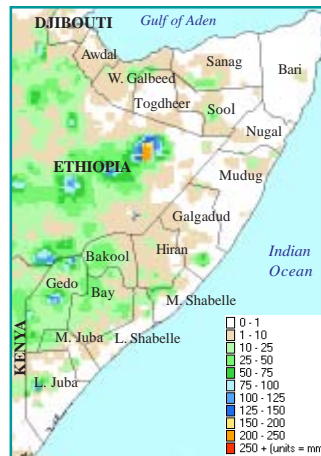

October '07: Cumulative Rainfall (mm)

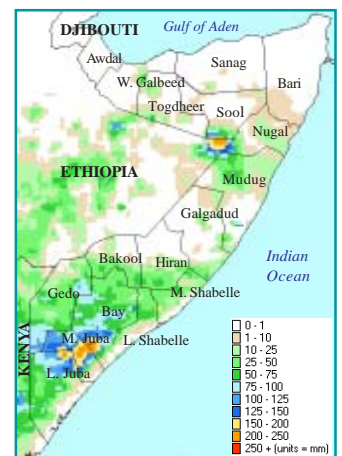

October '07: Dekadal Rainfall (RFE)
1st Dekad (1-10)

2nd Dekad (11-20)

3rd Dekad (21-31)

Rainfall Estimation (RFE)

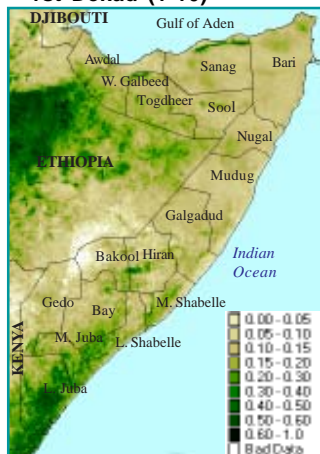

The Rainfall Estimation (RFE) imagery uses Meteosat infrared data, rain gauge reports from the global telecommunications system, and microwave satellite observations to provide RFE in mm at an approximate horizontal resolution of 10 km.

Normalized Difference Vegetation Index (NDVI)

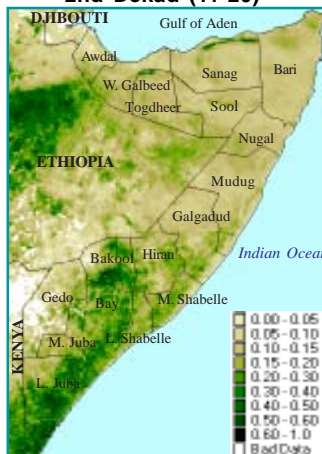

Normalized Difference Vegetation Index (NDVI) imagery is calculated from the red and near infra-red reflectance observed by the AVHRR (Advanced Very High Resolution Radiometer) sensor on NOAA meteorological satellites. The NDVI image provides an indication of the vigor and density (greenness) of vegetation at the surface.

October '07: Dekadal Normalized Difference Vegetation Index (NDVI)

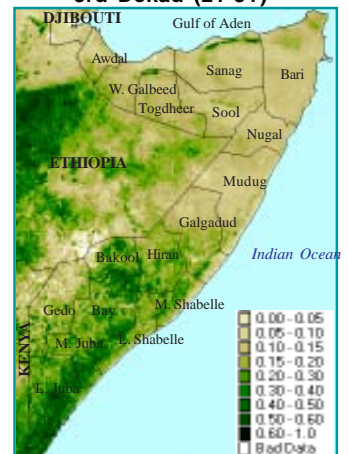

1st Dekad (1-10)

2nd Dekad (11-20)

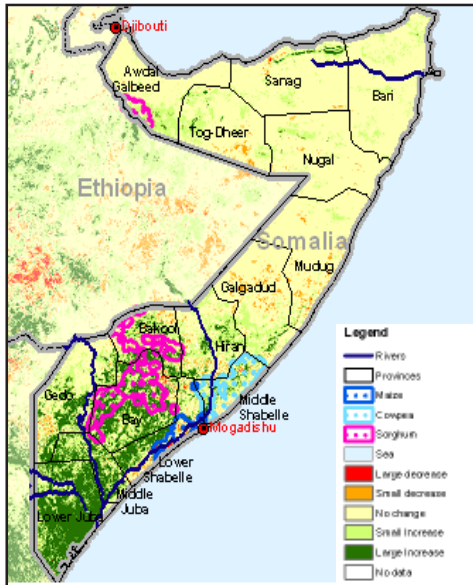

3rd Dekad (21-31)

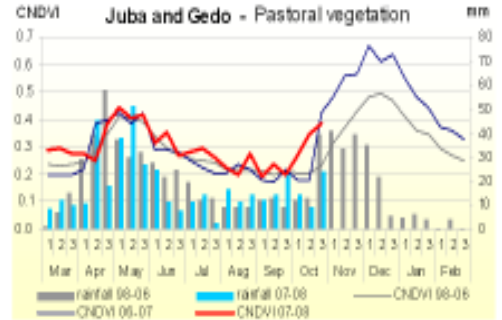

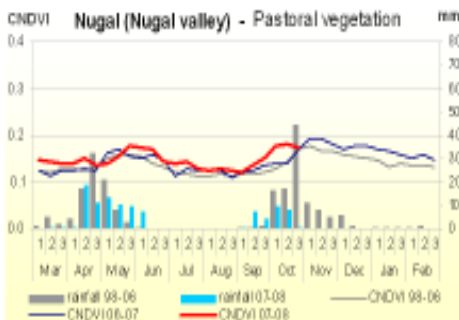

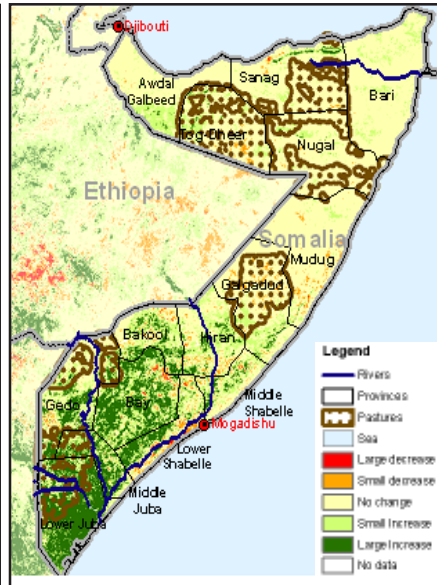

Seasonal Trends

Normalized Difference Vegetation Index (NDVI) is the monthly difference with the long term average (1998–2006).

October '07: NDVI Agricultural Areas

October '07: NDVI Pastoral Areas

All maps and graphs on this page are the products of Joint Research Centre / MARS-FOOD, which is funded by European Commission. Monitoring vegetation and rainfall conditions in Somalia using SPOT VGT Vegetation Index, AFRICOVER and ECMWF Global Meteorological Modelling.

Graphs present time series of time specific NDVI (line graphs) and RFE (bar charts) for each of the delineated areas in Somalia. The graphs compare the current season with the historic average and the previous year.

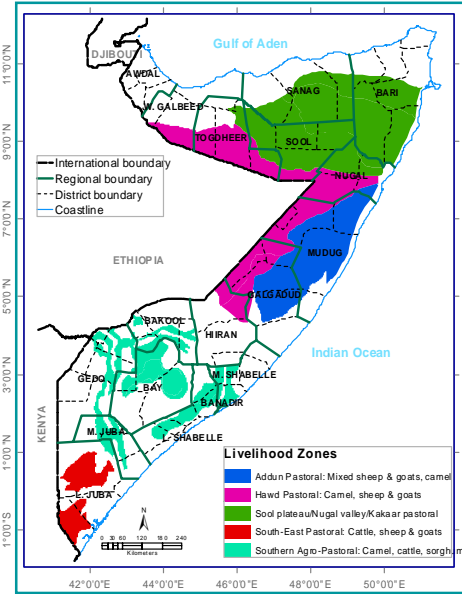

Mapped NDVI is the Monthly difference with the long term average (1998-2006).

Long Term Trends

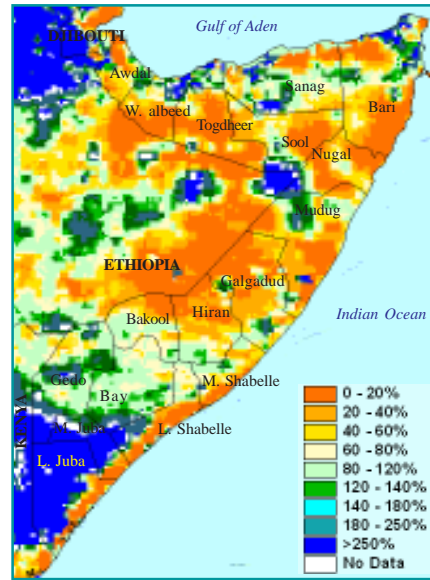

Time Series Data

The time series of rainfall and NDVI show trends in rainfall and vegetation. The time series of NDVI data (from 1982-present) allows analysis of changes in vegetation vigor and density in response to bio-physical conditions (including plant type, weather and soil). The primary use of these images is to compare the current state of rainfall and vegetation with previous time periods, for example the same time in an average year or a reference year to detect anomalous conditions.

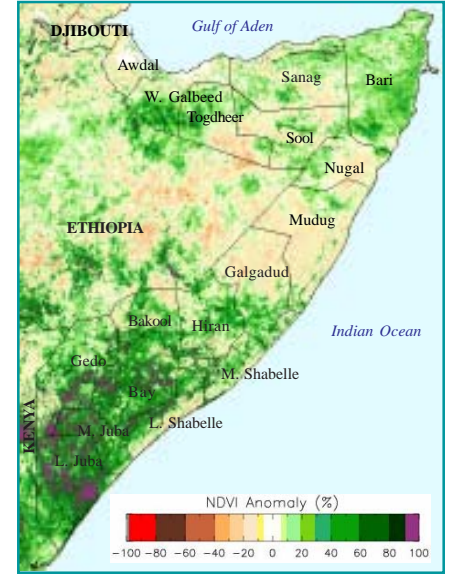

Livelihood Zones Used in Time Series Analysis

October '07: Rainfall as % of Long Term Mean

October '07: NDVI, as % of Long Term Mean

Historic NDVI % Deviation From Long Term Mean

Historic RFE % Deviation From Long Term Mean
